

Case Study – Vehicle Access

Client: Kyle Stewart Ltd, Installed at 33 Old Broad Street, Central London

Synopsis: With only a single access point to the underground parking and service area, **Movetech UK** was called in to engineer an effective solution to the difficulties of providing a management system for refuse vehicles collecting from the site.

A 6m diameter, 16 tonne capacity vehicle turntable was designed and installed, enabling vehicles to be rotated into position, saving time on deliveries and eradicating the need for multi-point turns. The dangers of reversing vehicles into busy congested roads were also overcome, allowing vehicles to be driven safely into and out of the limited access area.

The turntable also provided access to 2 car lifts servicing the sub-basement level of the building. In order to accommodate the limited headroom at the lower level, **Movetech UK** designed the revolve to be particularly low profile.
